

Create a child process from a parent process. Parent process contains an array of integers. Create a thread in both child and parent process so that child's thread prints the sum of array elements and parent's thread prints the multiplication of array elements.

Let's say array=[1,2,3,4]

Sample output

*sum* : 10  
*multiplication* : 24

Write your output to a file named your studentID.txt
